Description			
Hey!			
I noticed that Audacious playlist file extention is not present in Debian undstable mime definitions:			
<pre>\$ cat /etc/mime.types grep audpl \$</pre>			
I can file a bug report to debian, but maybe it's better if initiative comes from your side - please let me know.			
Thanks!

I don't think there needs to be MIME definition for .audpl. It's an internal format and not meant to be portable.

Got it. U discovered this issue after I exported such playlist to Desktop and wanted too open it with a mouse-click - it was treated as unknown, with default fallback as plain-text.

Simple workaround is to export plailist with "pls" extention.

I think this issue can be closed.

Thanks for fast response!
