Description

I have a lot of music from all over the world, and some artist names include diacritics. Examples my include *Sigur Rós*, *Die Ärzte* or *Måneskin*. I would like to be able to search for those artists without having to remember how to make different diacritics on my keyboard.
For example, searching *arzte* should show me *Die Ärtze*, *Ros* should show *Sigur Rós* and *Maneskin* should show *Måneskin*.
For other projects that do that - I know that Firefox allows for strictly matching text against diacritics when searching, so this maybe could show you how they normalize the data and allow searching it like that.
