Target version:			
Affects version:	3.7.1		

Description

Hello there.

I compile audacious into a standalone versioned directory at:

/Programs/Audacious/3.7.1/

The compilation was without error, Audacious compiled successfully.

Now, when I try to compile audacious-plugins 3.7.1 it tells me
that it can not find Audacious. Most software will be installed
at /usr/lib - I have symlinked all libraries to /System/Libraries
though.

I assume that audacious-plugins could be able to find the required
files, if it is to know to use /Programs/Audacious/3.7.1/ as the
prefix (rather than, let's say, /usr/).

Perhaps a proper way to enable this would be to add a
--with-audacious feature, in order to allow audacious-plugins
to find the above.

Thank you for reading! Great work with audacious, also very nice
and clean issue tracker here, better than trac. :D

History

#1 - January 04, 2016 08:38 - robert heiler

To clarify the above, what I mean with the:

--with-audacious

was actually this option:

--with-audacious=/Programs/Audacious/3.7.1

#2 - January 04, 2016 19:02 - John Lindgren

- Status changed from New to Rejected

Not necessary. See #186. Ask on the forums if you still need help.
