| Description | | | |
| <p>Hi,</p> <p>I think will be useful to control Audacious using network. I've tried audtool and I planning to develop a small server application in java that accept network command (telnet style) and calls audtool with the correct parameters. Audtool works great but to me is unclear how to:</p> <ol style="list-style-type: none">1) Get the list of the opened playlists2) Set the "active" playlist <p>Here: https://www.mankier.com/1/audtool#--set-current-playlist-name</p> <p>I found a command "--set-current-playlist-name title" but this command seems to be removed from the last version of audtool. Maybe I'm missing something...in that case could you please clarify how to use audtool.</p> <p>Did you plan to add network control capabilities built-in or with a plugin?</p> <p>Would you add (or re-add) the command to select the playlist using audtool?</p> <p>Thanks a lot for develop and maintain such a great player.</p> <p>Frank</p> | | | |

- Status changed from New to Rejected

You seem to be misinformed; the --set-current-playlist-name has not been removed.

--number-of-playlists will tell you how many playlists are open, and --set-current-playlist will set the current playlist.

The forum is a better place for general questions like this.
