Description			
Hi,			
Please remove useless Qt5 dependency for GT3 build.			
Qt5 is an enormous bazar that "GTK only" desktop environments must not have to install.

I'm not sure I understand the issue here. Are you using meson or ./configure && make?

If you're using ./configure, did you pass --disable-qt?

Yes, indeed, caused by the bug in both configure and meson : Qt is always required even if --disable-qt is passed to the configuration args.

Please take a look at my patch for configure : it's obvious :

```
if test "${enable_qt+set}" = set; then :
    enableval=$enable_qt; USE_QT=$enableval
else
-    USE_QT=yes
+    USE_QT=no
fi
```

It is really a bug !

No, you are misunderstanding the logic there. I build on a system without Qt before every release. It is not required.
